NeoVISOR

A national study to help improve emergency care for newborn babies with breathing difficulties.

This unit takes part in **NeoVISOR**, a research study looking at whether measurements taken during a baby's emergency transfer between hospitals can help predict which babies will need extra support, such as ECMO, or have an undiagnosed heart condition.

From speaking to families who have needed to be transferred to another hospital as part of their baby's care, we know this can be a stressful and overwhelming time. As such, we want to make sure families have information on this study available for when they have more time to think about it, rather than asking for your consent in the moment. Every family has the right to say no.

> **Your choice will not affect your baby's care** in any way, now or in the future — you do not need to give a reason, and you can change your mind at any time.
